## RPP DOOR LATCH

## THE RPP DOOR LATCH HAS BEEN REDESIGNED

Here at Cyberex we are always seeking ways to improve our products. Some improvements come from good new ideas but the best sometimes come from our customers.

The door on an RPP, like the door on a fine car, makes a strong initial impression just by how it feels when it is opened and closed. A solid and tight fit attests to a product's quality of materials and workmanship.

We have introduced a high-quality three point latching system to the doors of our RPP. Its rotating recessed handle simultaneously operates three strikers at the top, side and bottom of each door to achieve a tight and secure fit. The handle also has a lock that allows the key to be removed in either the locked or unlocked position.

All RPPs that are presently shipping use the new latching system shown in the photos. This is just another example of continuous improvements from Cyberex.

*The new Cyberex RPP latch is recessed when closed and hinges outward so that it can be rotated open. The closure mechanism provides a solid connection between the door and the RPP frame at three points around the perimeter.*
